PREFACE

Reading is the cornerstone of learning, yet it remains one of the most pressing challenges in education today. In response, the Division of **Bukidnon proudly introduces Bukidnon's Unified Literacy and Intervention Gateway (BULIG) —** a transformative innovation designed to improve learners' reading ability and empower every child to succeed.

BULIG is more than a program; it is a unified movement for literacy, built on collaboration, evidence-based strategies, and a deep commitment to equity in education. This initiative bridges gaps in reading proficiency by providing targeted interventions, innovative approaches, and sustainable support systems that cater to the diverse needs of learners across the division.

Anchored on this vision, the Division of Bukidnon integrates the ARAL Program (Academic Recovery and Accessible Learning), a national initiative focused on learning recovery and remediation. ARAL provides structured and learner-centered interventions for those struggling with foundational skills in reading and numeracy. By complementing BULIG's mission, ARAL strengthens the division's comprehensive approach to literacy, ensuring that learners overcome difficulties and gain the confidence to succeed academically. Together, these programs create a powerful synergy that accelerates learning recovery and builds a strong foundation for lifelong learning.

Through BULIG, we envision classrooms where every learner reads with confidence, comprehends with clarity, and learns with purpose. This gateway opens opportunities for lifelong learning, ensuring that no child is left behind in the journey toward academic excellence and personal growth.

Together, let us make literacy not just a goal, but a reality for al

Pre-Assessment

Direction: Read the selection and answer the comprehension check.

More than a million people immigrate to the United States to start new lives every year, and if they are arriving in New York, one of the first sights that they will see is the Statue of Liberty. The Statue of Liberty stands on Liberty Island, near Manhattan in New York. Though she is often thought to be a resident of New York, Liberty Island is actually federal property, which means that the Statue of Liberty belongs to the whole country. The Statue of Liberty is not only the tallest statue in America, but it is also one of the most recognizable American symbols.

The Statue of Liberty is huge. From the tip of the torch to the pedestal on which she stands, she is just over 151 feet tall. If you include the pedestal in your measurement, she stands more than 305 feet off the ground. That's more than 30 basketball hoops or an entire football field. Her waist size is 35 feet, which would make it awfully tough to find pants, and the tablet she holds is 23 feet long. Don't worry though; she hasn't had any trouble holding that tablet yet with her 8-foot index finger. Talk about heavy-handed…

Though America financed and built the pedestal on which the Statue of Liberty stands, the statue itself was a gift from France. In this way, the complete work, much like the United States, is a product of both American and French contributions. At one time, America was ruled by the British. The founding fathers of America chose to fight against Great Britain for the independence of their country. France supported America by providing money, men, and weapons of war. Had it not been for French contributions during the Revolutionary War, America would not exist in the way that it does today; therefore, it is quite fitting that the Statue of Liberty, which represents freedom, came to being by a joint American and French effort. On October 28th, 1886, just over one hundred years after America declared its independence from Great Britain, the Statue of Liberty was completed and dedicated by its designer, Frédéric Auguste Bartholdi.

Perhaps no person did more to bring the statue into being than Bartholdi. Not only did Bartholdi gain both French and American approval for the project, but he also led the French fundraising efforts and designed the appearance of the statue. The appearance of the Statue of Liberty is somewhat derived from Libertas, the Roman goddess of freedom. The torch represents how liberty enlightens the world. The seven points or rays coming from the top of the crown

represent the sun, the seven seas, the seven continents, and (as with the torch) how liberty enlightens the world. Though much of the statue was modeled after depictions of goddesses, Bartholdi modeled the face after his mother. Now that's a Mother's Day gift that's hard to top.

Though Bartholdi was responsible for the external appearance of the statue, the internal design can be largely credited to the innovative designer, Gustave Eiffel. Though Mr. Eiffel is best known for his contributions to a tower in Paris that is named after him, he also engineered the internal structure that holds up the Statue of Liberty. Eiffel chose to use a flexible structure so that changes in temperature and strong winds from the ocean would not cause the statue to crack. Because of Eiffel's crafty design, the Statue of Liberty may sway as much as three inches on a windy day. If the winds exceed 50 miles per hour, the torch may sway five inches. Eiffel is also responsible for including two spiraling staircases on the interior of the statue to help visitors reach the observation point in the crown.

While most people appreciate the Statue of Liberty today, during its construction in the 1870s, many Americans were critical of the project. Some took issue with the fact that Bartholdi was French. They believed that American monuments should be designed and constructed by Americans. Others felt that the statue wasn't much of a gift since it required Americans to foot the bill for the pedestal. After the Panic of 1873, America fell into a deep economic depression that lasted through much of the 1870s. (During an economic depression, people spend less money and it is harder to find jobs.) Because the nation was going through a depression, many Americans thought that money should not be spent to support a giant French statue. I think most Americans would now agree that it was a good inves

COMPREHENSION CHECK

1. What is the height from the torch tip to the pedestal?
   A. Just over 151 feet

   B. 35 feet

   C. 23 feet

   D. 305 feet

2. When was the Statue dedicated by its designer?
   A. 1776

   B. 1873

C. October 28th, 1886

D. 1906

3. What does the waist/tablet size imply about clothing or holding?

A. Easy to dress

B. Tough for pants, no issue holding tablet

C. Too small for visitors

D. Matches Eiffel Tower

4.Why might Americans criticize the 'gift' during the 1870s?

A. Bartholdi was American

B. U.S. paid pedestal amid depression

C. France built everything

D. No economic issues

5.What enables the statue to sway in wind without cracking?

A. Bartholdi's exterior

B. Eiffel's flexible internal structure

C. French concrete

D. Pedestal height

6.What do the crown's seven rays critically represent?

A. Seven U.S. states

B. French provinces

C. Sun, seas, continents, enlightenment

D. Bartholdi's family

7.Critically, why fitting for French-U.S. joint effort?

A. Britain funded it

B. French Revolutionary War aid for freedom

C. No historical ties

D. Eiffel disliked France

8.Who credits for face model vs. internal staircases?

A. Eiffel for face, Bartholdi for stairs

B. Bartholdi (mother's face), Eiffel (structure/stairs)

C. Both for everything

D. U.S. founders

9.Interpret text's view: Good investment despite criticism?

A. Yes, now iconic symbol

B. No, waste of money

C. Only for tourists

D. French regret

10.In the late 19th century, some critics argued that funding the Statue of Liberty was a poor investment. From an interpretive, long-term perspective, which reason best explains why it can now be seen as a good investment despite that criticism?

A. It generated immediate profit for all donors within a few years of completion

B. It replaced the need for any other public art or monuments in the United States

C. It became a powerful symbol that shaped national identity and democratic values over generations

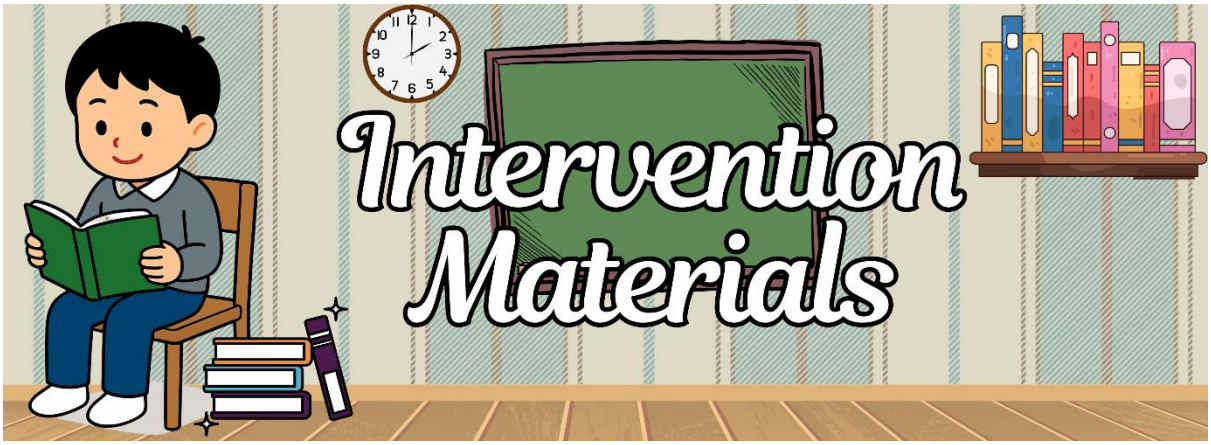

D. It was primarily responsible for eliminating all immigration restrictions in the 20th century whats the answer to this

10. C

Activity 1

CARVER, A MAN OF MANY TALENTS

George Washington Carver was an African American. He was a research chemist with many remarkable achievements in chemistry, economics, and industry.

George was born in 1864 to parents who had been slaves. The Civil War in America had set him free, but he chose to stay on the plantation of his former owner, Moses Carver. George learned how to care for plants instinctively and collected different plant species, creating his own botanical garden.

At the age of 8, George wanted to learn how to read, but the nearby schools were only for white children. He was given a blue-backed speller and learned all the words it contained in a short amount of time. Then, young George read the Bible. Perhaps his Bible readings helped him develop the ability to make friends.

At the age of 10, George left the Carvers to continue his studies. He found a home with the Watkins, who treated him like one of the family, similar to how the Carvers had done. George was a very fast learner and completed the entire primary school course in a single year. He worked his way through upper-grade school, high school, and college, ultimately earning a Bachelor of Science degree in Agriculture.

George was appointed head of the Department of Agricultural Research at a Negro university. There, he conducted an astonishing series of experiments. From peanuts, he developed nearly 300 products, including milk, butter, cheese, shaving lotion, breakfast food, flour, soap, ink, and cosmetics. From sweet potatoes, he developed 118 substances, including starch, vinegar, shoe blacking, library paste, and candies.

He developed dyes from clay, onions, beans, and tomatoes. He made oil paints from clay, peanuts, and cattle manure. From wood shavings, he created synthetic marble. However, peanuts were his main interest. Dr. Carver said, "From peanuts, one can find food and shelter; he can also produce medicine, washing powders, face bleach, candy, wallboards for homes, and hundreds of other things."

COMPREHENSION QUESTIONS

Choose the letter of the best answer:

1. When was George Washington Carver born?

   A. 1860

   B. 1864

   C. 1870

   D. 1880

2. What did George learn to do instinctively as a child on the Carver plantation?

   A. Read books

   B. Care for plants

   C. Cook meals

   D. Build gardens

3. What book did young George read after mastering the blue-backed speller?

   A. A science textbook

   B. The Bible

   C. A history book

   D. A dictionary

4. From peanuts, how many products did George Washington Carver develop?

   A. Nearly 100

   B. Nearly 200

   C. Nearly 300

   D. Nearly 400

5. From sweet potatoes, how many substances did he develop?

   A. 118

B. 200

C. 300

D. 325

Answer Key:

4. C
5. A

Activity 2

One of the modern world's intriguing sources of mystery has been airplanes vanishing in mid-flight. One of the more famous of these was the disappearance in 1937 of a pioneer woman aviator, Amelia Earhart.

On the second last stage of an attempted round the world flight, she had radioed her position as she and her navigator searched desperately for their destination, a tiny island in the Pacific. The plane never arrived at Howland Island. Did it crash and sink after running out of fuel? It had been a long haul from New Guinea, a twenty-hour flight covering some four thousand kilometers.

Did Earhart have enough fuel to set down on some other island on her radioed course? Or did she end up somewhere else altogether? One fanciful theory had her being captured by the Japanese in the Marshall Islands and later executed as an American spy; another had her living out her days under an assumed name as a housewife in New Jersey. Seventy years after Earhart's disappearance, 'myth busters' continue to search for her. She was the best-known American woman pilot in the world. People were tracking her flight with great interest when, suddenly, she vanished into thin air.

Aircraft had developed rapidly in sophistication after World War I, with the 1920s and 1930s marked by an aeronautical record-setting frenzy. Conquest of the air had become a global obsession. While Earhart was making headlines with her solo flights, other aviators like high-altitude pioneer Wiley Post and industrialist Howard Hughes were grabbing some glory of their own. But only Earhart, the reserved tomboy from Kansas who disappeared three weeks shy of her 40th birthday, still grips the public imagination.

Her disappearance has been the subject of at least fifty books, countless magazine and newspaper articles, and TV documentaries. It is seen by journalists as the last great American mystery.

There are currently two main theories about Amelia Earhart's fate. There were reports of distress calls from the Phoenix Islands made on Earhart's radio frequency for days after she vanished. Some say the plane could have broadcast only if it were on land, not in the water.

The Coast Guard and later the Navy, believing the distress calls were real, adjusted their searches, and newspapers at the time reported Earhart and her navigator were marooned on an island. No one was able to trace the calls at the time, so whether

Earhart was on land in the Phoenix Islands or there was a hoaxer in the Phoenix Islands using her radio remains a mystery.

Others dismiss the radio calls as bogus and insist Earhart and her navigator ditched in the water. An Earhart researcher, Elgen Long, claims that Earhart's airplane ran out of gas within fifty-two miles of the island and is sitting somewhere in a 6,000-square-mile area, at a depth of 17,000 feet. At that depth, the fuselage would still be in shiny, pristine condition if ever anyone were able to locate it. It would not even be covered in a layer of silt.

Those who subscribe to this explanation claim that fuel calculations, radio calls, and other considerations all show that the plane plunged into the sea somewhere off Howland Island. Whatever the explanation, the prospect of finding the remains is unsettling to many.

To recover skeletal remains or personal effects would be a grisly experience and an intrusion. They want to know where Amelia Earhart is, but that's as far as they would like to go. As one investigator has put it, "I'm convinced that the mystery is part of what keeps us interested. In part, we remember her because she's our favorite missing person."

COMPREHENSION QUESTIONS

Choose the letter of the correct answer.

1. In what year did Amelia Earhart disappear during her attempted round-the-world flight?

A. 1927

B. 1937

C. 1947

D. 1957

2. What was the destination island Earhart was searching for when she radioed her position before vanishing?

A. Marshall Islands

B. Phoenix Islands

C. Howland Island

D. New Guinea

3. Approximately how long was the flight from New Guinea to Howland Island, covering about 4,000 kilometers?

A. 10 hours

B. 20 hours

C. 30 hours

D. 40 hours

4. One fanciful theory suggested Earhart was captured by whom and executed as a spy?

A. British forces

B. Japanese in the Marshall Islands

C. U.S. Navy

D. Coast Guard

5. According to researcher Elgen Long, where is Earhart's plane likely located, within 52 miles of Howland Island?

A. On land in the Phoenix Islands

B. Buried on a tiny Pacific island

C. In a 6,000-square-mile area of ocean at 17,000 feet depth

D. Captured in the Marshall Islands

Answer key:

1. B
2. C
3. B
4. B
5.C

ACTIVITY 3

Marie Curie was one of the most accomplished scientists in history. Together with her husband, Pierre, she discovered radium, an element widely used for treating cancer, and studied uranium and other radioactive substances. Pierre and Marie's amicable collaboration later helped to unlock the secrets of the atom.

Marie was born in 1867 in Warsaw, Poland, where her father was a professor of physics. At an early age, she displayed a brilliant mind and a blithe personality. Her great exuberance for learning prompted her to continue her studies after high school. She became disgruntled, however, when she learned that the university in Warsaw was closed to women. Determined to receive a higher education, she defiantly left Poland and in 1891 entered the Sorbonne, a French university, where she earned her master's degree and doctorate in physics.

Marie was fortunate to have studied at the Sorbonne with some of the greatest scientists of her day, one of whom was Pierre Curie. Marie and Pierre were married in 1895 and spent many productive years working together in the physics laboratory. A short time after they discovered radium, Pierre was killed by a horse-drawn wagon in 1906. Marie was stunned by this horrible misfortune and endured heartbreaking anguish. Despondently, she recalled their close relationship and the joy that they had shared in scientific research. The fact that she had two young daughters to raise by herself greatly increased her distress.

Curie's feeling of desolation finally began to fade when she was asked to succeed her husband as a physics professor at the Sorbonne. She was the first woman to be given a professorship at the world-famous university. In 1911, she received the Nobel Prize in chemistry for isolating radium. Although Marie Curie eventually suffered a fatal illness from her long exposure to radium, she never became disillusioned about her work. Regardless of the consequences, she had dedicated herself to science and to revealing the mysteries of the physical world.

COMPREHENSION QUESTIONS

Read and understand the questions carefully. Choose the letter of the correct answer.

1. What can be inferred about Marie Curie's personality from her decision to leave Poland for education?

a. She was easily discouraged by obstacles.

b. She prioritized personal comfort over ambition.

c. She was determined and defiant in pursuing goals.

d. She preferred informal learning at home.

2. Based on the description of her collaboration with Pierre, what inference can be made about their relationship?

a. It was primarily competitive and independent.

b. It was harmonious and mutually supportive.

c. It focused solely on individual achievements.

d. It ended amicably before Pierre's death.

3. What does Marie's emotional response to Pierre's death and her subsequent actions imply about her resilience?

a. She quickly recovered and abandoned science.

b. Grief intensified her distress but she overcame it through work.

c. She became permanently despondent and isolated.

d. Raising daughters eliminated her career ambitions.

4. From her acceptance of the Sorbonne professorship and Nobel Prize, what can be inferred about her dedication?

a. She viewed awards as secondary to family life.

b. Barriers like gender did not deter her professional ascent.

c. She retired early due to health concerns.

d. Her success was accidental rather than earned.

5. Despite radium's fatal effects, what inference arises about Marie's commitment to science?

a. She grew disillusioned and regretted her research.

b. She accepted risks for advancing knowledge.

c. She stopped experimenting after health warnings.

d. Personal safety outweighed scientific discovery.

Answer Key

2. b

3. b

4. b

5. b

ACTIVITY 4

Mount Vesuvius, a volcano located between the ancient Italian cities of Pompeii and Herculaneum, has received much attention because of its frequent and destructive eruptions. The most famous of these eruptions occurred in A.D. 79.

The volcano had been inactive for centuries. There was little warning of the coming eruption, although one account unearthed by archaeologists says that a hard rain and a strong wind had disturbed the celestial calm during the preceding night. Early the next morning, the volcano poured a huge river of molten rock down upon Herculaneum, completely burying the city and filling the harbor with coagulated lava.

Meanwhile, on the other side of the mountain, cinders, stones, and ash rained down on Pompeii. Sparks from the burning ash ignited the combustible rooftops quickly. Large portions of the city were destroyed in the conflagration. Fire, however, was not the only cause of destruction. Poisonous sulfuric gases saturated the air. These heavy gases were not buoyant in the atmosphere and therefore sank toward the earth and suffocated people.

Over the years, excavations of Pompeii and Herculaneum have revealed a great deal about the behavior of the volcano. By analyzing data, much as a zoologist dissects an animal specimen, scientists have concluded that the eruption changed large portions of the area's geography. For instance, it turned the Sarno River from its course and raised the level of the beach along the Bay of Naples. Meteorologists studying these events have also concluded that Vesuvius caused a huge tidal wave that affected the world's climate.

In addition to making these investigations, archaeologists have been able to study the skeletons of victims by using distilled water to wash away the volcanic ash. By strengthening the brittle bones with acrylic paint, scientists have been able to examine the skeletons and draw conclusions about the diet and habits of the residents. Finally, the excavations at both Pompeii and Herculaneum have yielded many examples of classical art, such as jewelry made of bronze, which is an alloy of copper and tin. The eruption of Mount Vesuvius and its tragic consequences have provided everyone with a wealth of data about the effects that volcanoes can have on the surrounding area. Today, volcanologists can locate and predict eruptions, saving lives and preventing the destruction of other cities and cultures.

COMPREHENSION QUESTIONS

Choose the letter of the correct answer.

1. What can be inferred about the initial warning signs before the A.D. 79 eruption?

a. Earthquakes provided clear months of advance notice.

b. Dormancy led residents to ignore subtle natural disturbances.

c. Roman authorities issued evacuation orders promptly.

d. The volcano showed glowing activity nightly.

2. Why was Herculaneum buried more rapidly than Pompeii?

a. It received heavier rain of cinders and ash
b. Proximity allowed molten rock to flow directly into it first.

c. Fires spread faster on its rooftops.

d. Sulfuric gases targeted it exclusively.

3.What inference explains deaths in Pompeii beyond fire damage?

a. All victims drowned in the Sarno River's flood.

b. Heavy poisonous gases sank and suffocated people.

c. Tidal waves swept through the streets.

d. Earthquakes collapsed all buildings instantly.

4. How do excavation methods imply skeletons were fragile?

a. They dissolved in volcanic ash without treatment.

b. Washing with distilled water and acrylic paint preserved them for study.

c. Bronze jewelry protected them naturally.

d. Tidal wave debris embedded them deeply.

5. What broader inference about volcanoes stems from Vesuvius data?

a. Eruptions never alter geography or climate.

b. Modern predictions save lives based on past events.

c. Artifacts alone predict future activity.

d. All effects are limited to local fires.

ACTIVITY 5

The victory of the small Greek democracy of Athens over the mighty Persian Empire in 490 B.C. is one of the most famous events in history. Darius, the king of the Persian Empire, was furious because Athens had interceded for the other Greek city-states in revolt against Persian domination. In anger, the king sent an enormous army to defeat Athens, thinking it would take drastic steps to pacify the rebellious part of the empire.

Persia was ruled by one man. In Athens, however, all citizens helped to rule. Ennobled by this participation, Athenians were prepared to die for their city-state. Perhaps this was the secret of the remarkable victory at Marathon, which freed them from Persian rule. On their way to Marathon, the Persians tried to fool some Greek city-states by claiming to have come in peace. The frightened citizens of Delos refused to believe this. Not wanting to abet the conquest of Greece, they fled from their city and did not return until the Persians had left. They were wise, for the Persians next conquered the city of Eritrea and captured its people.

Tiny Athens stood alone against Persia. The Athenian people went to their sanctuaries. There, they prayed for deliverance and asked their gods to expedite their victory. The Athenians refurbished their weapons and moved to the plain of Marathon, where their little band would meet the Persians. At the last moment, soldiers from Plataea reinforced the Athenian troops.

The Athenian army attacked, and Greek citizens fought bravely. The power of the mighty Persians was offset by the love that the Athenians had for their city. Athenians defeated the Persians in both archery and hand combat. Greek soldiers seized Persian ships and burned them, and the Persians fled in terror. Herodotus, a famous historian, reports that 6,400 Persians died, compared to only 192 Athenians.

COMPREHENSION QUESTIONS

Choose the letter of the correct answer.

1. What primarily provoked King Darius to send an army against Athens?

A.Athens' direct conquest of Persian territories

B. Athens' support for Greek city-states revolting against Persia

C. A trade dispute over resources at Marathon

D. Personal rivalry between Darius and Athenian leaders

2. How did the citizens of Delos respond to the Persians' claim of peaceful intentions?

A. They welcomed and allied with the Persians

B. They refused to believe it and fled their city

C. They joined the Athenians in battle preparations

D. They negotiated a truce independently

3. What reinforcements arrived to support Athens just before the battle?

A. Soldiers from Sparta

B. Troops from Delos

C. Forces from Plataea

D. Naval aid from Eretria

4. According to Herodotus, what were the reported casualties in the battle?

A. 6,400 Athenians and 192 Persians

B. 192 Plataeans and 6,400 Delians

C. 6,400 Persians and 192 Athenians

D. Equal losses on both sides

5. What factor does the account suggest offset Persian numerical superiority?

A. Advanced Greek weaponry

B. Athenians' love for their city-state and citizen rule

C. Persian ships being burned early

D. Divine intervention alone

Answer Key:

3.C

4.C

5.B

ACTIVITY 6

One of the most intriguing stories of the Russian Revolution concerns the identity of Anastasia, the youngest daughter of Czar Nicholas II. During his reign over Russia, the czar had planned to revoke many of the harsh laws established by previous czars. Some workers and peasants, however, clamored for more rapid social reform. In 1918, a group of these people known as Bolsheviks overthrew the government. On July 17 or 18, they murdered the czar and what was thought to be his entire family. Although witnesses vouched that all the members of the czar's family had been executed, there were rumors suggesting that Anastasia had survived. Over the years, a number of women claimed to be Grand Duchess Anastasia. Perhaps the most famous claimant was Anastasia Tschaikovsky, who was also known as Anna Anderson.

In 1920, 18 months after the czar's execution, this terrified young woman was rescued from drowning in a Berlin river. She spent two years in a hospital, where she attempted to reclaim her health and shattered mind. The doctors and nurses thought that she resembled Anastasia and questioned her about her background. She disclaimed any connection with the czar's family. Eight years later, however, she claimed that she was Anastasia. She said that she had been rescued by two Russian soldiers after the czar and the rest of her family had been killed. Two brothers named Tschaikovsky had carried her into Romania. She had married one of the brothers, who had taken her to Berlin and left her there, penniless and without a vocation. Unable to invoke the aid of her mother's family in Germany, she had tried to drown herself.

During the next few years, scores of the czar's relatives, ex-servants, and acquaintances interviewed her. Many of these people said that her looks and mannerisms were evocative of the Anastasia that they had known. Her grandmother and other relatives denied that she was the real Anastasia, however.

Tired of being accused of fraud, Anastasia immigrated to the United States in 1928 and took the name Anna Anderson. She still wished to prove that she was Anastasia, though, and returned to Germany in 1933 to bring suit against her mother's family. There she declaimed to the court, asserting that she was indeed Anastasia and deserved her inheritance.

In 1957, the court decided that it could neither confirm nor deny Anastasia's identity. Although it will probably never be known whether this woman was the Grand Duchess Anastasia, her search to establish her identity has been the subject of numerous books, plays, and movies.

COMPREHENSION QUESTIONS

Choose the letter of the correct answer.

1. What year did the woman later known as Anna Anderson first claim to be Anastasia?

A. 1920

B. 1922

C. 1928

D. 1933

2. According to her story, how did Anna Anderson say she survived the execution of the czar's family?

A. She hid in the basement during the shooting.

B. She was rescued by two Russian soldiers named Tschaikovsky.

C. She escaped with her grandmother's help in Germany.

D. She was smuggled out by Bolshevik sympathizers.

3. What was the outcome of the 1957 court decision regarding Anna Anderson's identity?

A. The court confirmed she was Anastasia.

B. The court ruled she was an impostor named Franziska Schanzkowska.

C. The court could neither confirm nor deny her identity.

D. The case was dismissed due to lack of evidence.

4. Why did many of the czar's relatives, ex-servants, and acquaintances find Anna Anderson convincing at first?

A. She provided detailed financial records from the Romanov fortune.

B. Her looks and mannerisms resembled the Anastasia they knew.

C. She passed multiple DNA tests linking her to the family.

D. She spoke fluent Russian and recalled state secrets.

5. What action did Anna Anderson take in 1933 after immigrating to the United States?

A. She published a book detailing her escape.

B. She returned to Germany to sue her mother's family for inheritance.

C. She underwent DNA testing to prove her identity.

D. She renounced her claim and lived quietly.

Answer key:

1. C
2. B
3. C
4. B
5. B

ACTIVITY 7

Many great inventions are initially greeted with ridicule and disbelief. The invention of the airplane was no exception. Although many people who heard about the first powered flight on December 17, 1903, were excited and impressed, others reacted with peals of laughter. The idea of flying an aircraft was repulsive to some people. Such people called Wilbur and Orville Wright, the inventors of the first flying machine, impulsive fools. Negative reactions, however, did not stop the Wrights. Impelled by their desire to succeed, they continued their experiments in aviation.

Orville and Wilbur Wright had always had a compelling interest in aeronautics and mechanics. As young boys, they earned money by making and selling kites and mechanical toys. Later, they designed a newspaper-folding machine, built a printing press, and operated a bicycle-repair shop. In 1896, when they read about the death of Otto Lilienthal, the brothers' interest in flight grew into a compulsion.

Lilienthal, a pioneer in hang-gliding, had controlled his gliders by shifting his body in the desired direction. This idea was repellent to the Wright brothers, however, and they searched for more efficient methods to control the balance of airborne vehicles. In 1900 and 1901, the Wrights tested numerous gliders and developed control techniques. The brothers' inability to obtain enough lift power for the gliders almost led them to abandon their efforts.

After further study, the Wright brothers concluded that the published tables of air pressure on curved surfaces must be wrong. They set up a wind tunnel and began a series of experiments with model wings. Because of their efforts, the old tables were repealed in time and replaced by the first reliable figures for air pressure on curved surfaces. This work, in turn, made it possible for the brothers to design a machine that would fly. In 1903, the Wrights built their first airplane, which cost less than $1,000. They even designed and built their own source of propulsion—a lightweight gasoline engine. When they started the engine on December 17, the airplane pulsated wildly before taking off. The plane managed to stay aloft for 12 seconds, however, and it flew 120 feet.

By 1905, the Wrights had perfected the first airplane that could turn, circle, and remain airborne for half an hour at a time. Others had flown in balloons and hang gliders, but the Wright brothers were the first to build a full-size machine that could fly under its own power. As the contributors to one of the most outstanding engineering achievements in history, the Wright brothers are accurately called the fathers of aviation.

COMPREHENSION QUESTIONS

Choose the letter of the correct answer.

Question 1: Initial Public Reaction

What does the passage imply about why some people ridiculed the Wright brothers' airplane?

A. The high cost of the invention

B. Fear of the repulsive idea of machine-powered flight

C. Jealousy over the brothers' mechanical skills

D. Disbelief in their bicycle business success

Question 2: Brothers' Early Interests

How did the Wright brothers' background in kites, printing, and bicycles most directly contribute to their aviation success?

A. Provided funds for wind tunnel construction

B. Built practical skills in mechanics and aeronautics

C. Inspired them to copy Otto Lilienthal's designs

D. Led to immediate glider lift achievements

Question 3: Response to Lilienthal's Method

Why did the Wright brothers reject Lilienthal's body-shifting control for gliders?

A. It was too physically demanding

B. It required curved surfaces

C. Lilienthal's death proved it unsafe

D. They sought more efficient balance methods

Question 4: Key Scientific Breakthrough

What was the primary outcome of the Wrights' wind tunnel experiments?

A. Replaced inaccurate tables with reliable data

B. Confirmed existing air pressure tables

C. Developed a lightweight gasoline engine

D. Achieved lift without curved surfaces

Question 5: Milestone Achievements

Which statement best evaluates the Wrights' progression from 1903 to 1905?

A. Early flights lasted half an hour immediately

B. Abandoned gliders after initial failures

C. Perfected control for turns, circles, and 30-minute flights

D. Relied on balloons for sustained power

Answer key:

1. B
2. B
3. D
4. A
5.C

ACTIVITY 8

In the 16th century, an age of great marine and terrestrial exploration, Ferdinand Magellan led the first expedition to sail around the world. As a young Portuguese noble, he served the king of Portugal, but he became involved in the quagmire of political intrigue at court and lost the king's favor. After he was dismissed from service by the king of Portugal, he offered to serve the future Emperor Charles V of Spain.

A papal decree of 1493 had assigned all land in the New World west of 50 degrees W longitude to Spain and all the land east of that line to Portugal. Magellan offered to prove that the East Indies fell under Spanish authority. On September 20, 1519, Magellan set sail from Spain with five ships. More than a year later, one of these ships was exploring the topography of South America in search of a water route across the continent. This ship sank, but the remaining four ships searched along the southern peninsula of South America. Finally, they found the passage they sought near 50 degrees S latitude. Magellan named this passage the Strait of All Saints, but today it is known as the Strait of Magellan.

One ship deserted while in this passage and returned to Spain, so fewer sailors were privileged to gaze at that first panorama of the Pacific Ocean. Those who remained crossed the meridian now known as the International Date Line in the early spring of 1521 after 98 days on the Pacific Ocean.

During those long days at sea, many of Magellan's men died of starvation and disease.

Later, Magellan became involved in an insular conflict in the Philippines and was killed in a tribal battle. Only one ship and 17 sailors under the command of the Basque navigator Elcano survived to complete the westward journey to Spain and thus prove once and for all that the world is round, with no precipice at the edge.

COMPREHENSION QUESTIONS

Choose the letter of the correct answer.

1. What does the passage imply about the role of political intrigue in Magellan's career shift?

A. It strengthened his loyalty to Portugal.

B. It forced him to seek opportunities elsewhere.

C. It made him abandon noble status.

D. It directly caused the papal decree.

2. How does the passage interpret the significance of the papal decree in motivating Magellan's voyage?

A. It assigned all global lands equally.

B. It focused only on South America.

C. It prohibited Spanish exploration.

D. It provided a legal basis for claiming the East Indies.

3. What interpretive insight does the passage offer about the challenges of Pacific crossing?

A. It was swift and well-supplied.

B. It highlighted human endurance limits through starvation.

C. Crews enjoyed panoramic views daily.

D. No ships were lost in the ocean.

4.The passage portrays Magellan's death as what kind of turning point?

A. An avoidable delay in return.

B. A triumphant conquest

C. Proof of peaceful diplomacy.

D. Completion of the full circle.

5.What broader interpretation does the passage make about the expedition's legacy despite losses?

A. It confirmed flat Earth theories.

B. Survivors empirically proved Earth's sphericity.

C. All ships returned intact.

D. Exploration avoided all risks.

Answer key:

1. B
3. D
4. B
5. A
6. B

ACTIVITY 9

Conflict had existed between Spain and England since the 1570s. England wanted a share of the wealth that Spain had been taking from the lands it had claimed in the Americas.

Elizabeth I, Queen of England, encouraged her staunch admiral of the navy, Sir Francis Drake, to raid Spanish ships and towns. Though these raids were on a small scale, Drake achieved dramatic success, adding gold and silver to England's treasury and diminishing Spain's supremacy.

Religious differences also caused conflict between the two countries. Whereas Spain was Roman Catholic, most of England had become Protestant. King Philip II of Spain wanted to claim the throne and make England a Catholic country again. To satisfy his ambition and also to retaliate against England's theft of his gold and silver, King Philip began to build his fleet of warships, the Spanish Armada, in January 1586.

Philip intended his fleet to be indestructible. In addition to building new warships, he marshaled 130 sailing vessels of all types and recruited more than 19,000 robust soldiers and 8,000 sailors. Although some of his ships lacked guns and others lacked ammunition, Philip was convinced that his Armada could withstand any battle with England.

The martial Armada set sail from Lisbon, Portugal, on May 9, 1588, but bad weather forced it back to port. The voyage resumed on July 22 after the weather became more stable.

The Spanish fleet met the smaller, faster, and more maneuverable English ships in battle off the coast of Plymouth, England, first on July 31 and again on August 2. The two battles left Spain vulnerable, having lost several ships and with its ammunition depleted. On August 7, while the Armada lay at anchor on the French side of the Strait of Dover, England sent eight burning ships into the midst of the Spanish fleet to set it on fire. Blocked on one side, the Spanish ships could only drift away, their crews in panic and disorder. Before the Armada could regroup, the English attacked again on August 8.

Although the Spaniards made a valiant effort to fight back, the fleet suffered extensive damage. During the eight hours of battle, the Armada drifted perilously close to the rocky coastline. At the moment when it seemed that the Spanish ships would be driven onto the English

shore, the wind shifted, and the Armada drifted out into the North Sea. The Spaniards recognized the superiority of the English fleet and returned home, defeated.

COMPREHENSION QUESTIONS

Choose the letter of the correct answer.

1. What does the passage primarily imply about the economic roots of the Spain-England conflict?

A. England's raids were minor and ineffective.

B. Spain's American wealth fueled English aggression and raids.

C. Philip II shared treasures voluntarily.

D. Drake's success depleted England's treasury.

2. How does the text interpret King Philip II's dual ambitions in launching the Armada?

A. Purely economic retaliation against raids.

B. Defense of Portuguese ports only.

C. Religious restoration of Catholicism and throne claim in England.

D. Alliance-building with Protestant England.

3.What interpretive role does weather play in the Armada's early setbacks according to the passage?

A. It completely prevented the fleet from sailing.

B. It forced a delay but allowed resumption, highlighting Philip's overconfidence.

C. English ships used it to raid Lisbon.

D. It aided Spanish regrouping in the North Sea.

4. The passage interprets the English burning ships tactic as what kind of strategic advantage?

A. A direct assault on Spanish soldiers.

B. Signaling alliance with France.

C. Replenishing Spanish ammunition.

D. Creating panic and disorder, blocking maneuvers in the Strait of Dover

5. Overall, what does the narrative suggest about the Armada's defeat beyond numerical superiority?

A. English ships were larger and slower.

B. Spanish flaws like poor armament, weather shifts, and English maneuverability led to recognition of inferiority.

C. Philip's fleet remained indestructible.

D. The wind shift doomed England instead.

Answer key:

1. B
2. B
3. B
4. B
5. B

ACTIVITY 10

Do you know the difference between a submarine and a submersible? A submarine is a watercraft capable of independent operation under the sea. Submarines do not require support ships because they can renew their air and power supplies independently. Submersibles also submerge and operate underwater, but they need the support of a larger vessel. Submersibles cannot renew their air and power supplies without support. For this reason, submersibles are usually smaller and cannot spend as much time underwater as submarines.

The first documented submersible was constructed in 1620 by Cornelius Drebbel. It was powered by rowing oars underwater. Though this craft was originally designed for underwater exploration, it did not take long for inventors and makers of war to recognize the military potential of the submersible. In 1648, Bishop John Wilkins wrote, "It may be of great advantage against a Navy of enemies, who by this may be undermined in the water and blown up." Over one hundred years later, the first military submarine was ready to be deployed. The Turtle was the world's first submarine used in combat. Designed by David Bushnell in 1775, it was deployed by the Continental Army during the American Revolutionary War. Though the Turtle did utilize a support ship in combat, it was fully capable of renewing its air and power supplies independently; therefore, the Turtle is considered to have

been a submarine and not a submersible. The Turtle was powered by hand-cranked propellers and was named as such because it resembled a turtle. It held a single person, moved about three miles per hour in calm water, and contained enough air to stay submerged for about thirty minutes.

General Washington authorized an attack using the Turtle on a British flagship blockading New York Harbor. Sgt. Ezra Lee operated the Turtle and attempted to affix underwater explosives to the British ship, but he failed. The Turtle was later destroyed by the British. Despite this failure, the Turtle is still remembered as the first submarine used offensively during war. Another notable submarine originally designed for war was Julius H. Kroehl's Submarine Explorer. Built between 1863 and 1866, this submarine was created for the North during the American Civil War, but the war ended before it went into use. After the war, it was used commercially to harvest pearls in Panamanian waters during the late 1860s. Unfortunately, the dangers of decompression sickness (a condition that occurs when divers rise to the water's surface too quickly) were not understood. While

experimenting with the Submarine Explorer in 1867, Kroehl himself perished from decompression sickness. In 1869, a new engineer put the Submarine Explorer back to the task of harvesting pearls. Tragically, the use of the Submarine Explorer was discontinued after the entire crew died from decompression sickness. Submarine use increased greatly during World War I. Due to innovations in engineering, such as a dual power system using both diesel and electric sources, submarines had finally developed into effective war machines.

One watercraft called the U-Boat was put to great effect by the Germans. Some argue that the U-Boat was more of a submersible, since U-Boats operated primarily on the surface using diesel engines and submerged only occasionally to attack using battery power, but the effectiveness of the U-Boat in combat is certain. During World War I, more than 5,000 Allied ships were sunk by U-Boats, including the Lusitania, which is often cited as a reason why America entered the war. U-Boats were again utilized extensively by the Germans during World War II. Though the U-Boats were devastating to British fleets, advances in technology such as radar and sonar reduced their overall effectiveness. Additionally, the U.S. had also developed and deployed a fleet of submarines to great effect. Though the Japanese attack on Pearl Harbor destroyed or severely damaged many of the U.S. Navy's frontline Pacific Fleet ships, U.S. submarines survived the attack and went on to cause great damage. Submarines, though only about 2 percent of the U.S. Navy, destroyed over 30 percent of the Japanese Navy. This made U.S. submarines the most effective anti-ship and antisubmarine weapon in the entire American arsenal. Modern submarines are now powered by a nuclear reactor. The nuclear reactor generates a tremendous amount of power and frees the submarine from the need to occasionally

COMPREHENSION QUESTIONS

Choose the letter of the correct answer.

1. What does the passage imply as the primary reason submersibles like Drebbel's 1620 craft were limited compared to later submarines?

A. Dependence on support for air and power renewal, restricting duration and size.

B. Lack of military recognition until Wilkins' 1648 comment.

C. Inability to resemble a turtle shape for camouflage.

D. Over-reliance on rowing oars instead of propellers.

2. Why does the passage classify the Turtle (1775) as a submarine despite using a support ship in combat?

A. It resembled a turtle and held one person.

B. Its independent air and power renewal via hand-cranked propellers.

C. Success in sinking the British flagship.

D. Deployment by General Washington alone.

3. What interpretive lesson about early submarine risks emerges from the Submarine Explorer's pearl harvesting in the 1860s?

A. War ended before effective use, so risks were irrelevant.

B. Ununderstood decompression sickness doomed Kroehl and crew despite post-Civil War commercial shift.

C. Compressed air systems prevented all dangers.

D. Panama waters were too shallow for issues.

4. How does the passage interpret U-Boats' WWI success (over 5,000 Allied ships sunk) despite surface-primary operation?

A. They were true submarines with unlimited battery power.

B. Lusitania sinking was accidental.

C. Dual diesel-electric system made them effective war machines, even if debated as submersibles

D. No Allied countermeasures existed.

5. What broader implication does the passage suggest about modern nuclear submarines from WWII U.S. effectiveness (30% Japanese Navy destruction)?

A. Submarines remain 2% of fleets but dominate via reactors freeing surface needs.

B. Pearl Harbor proved surface vulnerability irrelevant.

C. U-Boats' radar defeats ended all submarine utility.

D. Smaller size always limits impact.

Answer key:

1. A
2. B
3. B
4. C
5. A

Post-Assessment
TEST

Direction: Read the selection below and answer the comprehension check.

In 1892, the Sierra Club was formed. In 1908, an area of coastal redwood trees north of San Francisco was established as Muir Woods National Monument. In the Sierra Nevada Mountains, a walking trail from Yosemite Valley to Mount Whitney was dedicated in 1938. It is called the John Muir Trail.

John Muir was born in 1838 in Scotland. His family name means "moor," which is a meadow full of flowers and animals. John loved nature from the time he was small. He also liked to climb rocky cliffs and walls. When John was 11 years old, his family moved to the United States and settled in Wisconsin. John was good with tools and soon became an inventor. He first invented a model of a sawmill. Later, he invented an alarm clock that would cause the sleeping person to be tipped out of bed when the timer sounded.

Muir left home at an early age. He took a 1,000-mile walk south to the Gulf of Mexico in 1867 and 1868. Then he sailed for San Francisco. The city was too noisy and crowded for Muir, so he headed inland for the Sierra Nevadas.

When Muir discovered the Yosemite Valley in the Sierra Nevadas, it was as if he had come home. He loved the mountains, the wildlife, and the trees. He climbed the mountains and even climbed trees during thunderstorms in order to get closer to the wind. He put forth the theory in the late 1860s that the Yosemite Valley had been formed through the action of glaciers. People ridiculed him. Not until 1930 was Muir's theory proven correct.

Muir began to write articles about the Yosemite Valley to tell readers about its beauty. His writing also warned people that Yosemite was in danger from timber mining and sheep ranching interests. In 1901, Theodore Roosevelt became president of the United States. He was interested in conservation. Muir took the president through Yosemite, and Roosevelt helped get legislation passed to create Yosemite National Park in 1906.

Although Muir won many conservation battles, he lost a major one. He fought to save the Hetch Hetchy Valley, which people wanted to dam in order to provide water for San Francisco. In late 1913, a bill was signed to dam the valley. Muir died in 1914. Some people say losing the fight to protect the valley killed Muir.

COMPREHENSION QUESTIONS

Choose the letter of the correct answer.

1. In what year was the Sierra Club formed?
   A. 1908
   B. 1892
   C. 1938
   D. 1914

2. Where was John Muir born?
   A. Wisconsin
   B. San Francisco
   C. Scotland
   D. Yosemite Valley

3. Why did Muir leave San Francisco after arriving there?
   A. To visit the Gulf of Mexico
   B. The city was too noisy and crowded
   C. To invent new tools
   D. To climb trees in thunderstorms

4. What did Muir's alarm clock invention do?
   A. Saw wood automatically
   B. Tipped the sleeping person out of bed
   C. Measured glaciers
   D. Warned of sheep ranching

5.What does the text suggest Muir felt upon discovering Yosemite Valley?

A. Fear of the wildlife
B. It was like coming home

C. Disappointment in the crowds

D. Boredom with the mountains

6. Why was Muir's glacier theory initially ridiculed?

A. It supported timber mining

B. People did not believe Yosemite was formed by glaciers

C. He climbed trees during storms

D. Roosevelt disagreed with it

7.How did Muir's writing contribute to conservation?

A. It described Yosemite's beauty and warned of dangers

B. It invented new trails

C. It promoted sheep ranching

D. It detailed his inventions only

8.What major conservation loss is linked to Muir's death?

A. Formation of the Sierra Club

B. Damming of Hetch Hetchy Valley

C. Dedication of the John Muir Trail

D. Roosevelt's Yosemite visit

9. The text implies Muir's family name "moor" connected to his life how?

A. His love for inventing tools

B. Early love for nature like meadows full of flowers and animals

C. Climbing rocky cliffs

D. Walking 1,000 miles south

10. What does the damming of Hetch Hetchy Valley shortly after John Muir's death suggest about the limits of his influence on American conservation

A. His inventions had no lasting environmental impact.

B. Despite his successes like founding the Sierra Club and promoting Yosemite, utilitarian demands for resources ultimately prevailed over pure preservation in key battles.

C. Sheep ranching was the primary threat he overlooked.

D. His glacier theory gained widespread acceptance too late.

Answer key:

1. B
2. C
3. B
4. B
5. B
6. B
7. A
8. B
9. B
